

Management of a Controlled Bleeding Situation at SMH

If patient has antibodies (current or historical) this trigger may not be available. In this situation the clinical team must discuss with the Biomedical Scientist in the Transfusion Laboratory.

**Patient's that are unknown to ICHNT must have 2 samples sent to activate this trigger; approximate time to issue crossmatched blood is 2 hours. These samples must be taken at two different times and preferably by two different people.*

If sample(s) are required, please send directly to the Blood Transfusion pod station #3737 or #1032.
